CYBERAWARE CAMPUS

An Interactive Cybersecurity Awareness and Learning Platform

B.Tech CSE Mini Project Documentation

Live Application

https://cyber-campus-guard.base44.app

Built with Base44 AI App Builder

Prepared as project documentation. Replace the student and institution placeholders before submitting.

Project Information

Project Name	CyberAware Campus
Project Type	B.Tech CSE Mini Project
Application URL	cyber-campus-guard.base44.app
Development Tool	Base44 AI App Builder
Prepared by	[Your Name]
Institution	[College Name]

Documentation note

This document describes the intended design and planned/typical functionality of CyberAware Campus based on the project concept. Verify each feature in the live application before presenting it as implemented. Screenshots, measured results, and internal implementation details have not been independently verified for this document.

12. Future Enhancements
13. Conclusion
14. GitHub Repository Notes
15. References

1. Abstract

CyberAware Campus is a web-based cybersecurity awareness and learning platform intended to help college students recognize common online risks and practice safer digital habits. The project focuses on educational topics such as phishing, social engineering, suspicious links, password safety, public Wi-Fi risks, and digital privacy. The proposed learning experience combines short lessons, multiple-choice quizzes, fictional threat scenarios, and progress feedback. The application was created using Base44, an AI-assisted app-building platform that supports the generation of user interfaces and application workflows. The platform is intended for awareness training and is not a replacement for professional security tools or incident-response services.

2. Introduction

Students use online learning portals, email, messaging applications, cloud services, and public networks as part of everyday academic life. These activities can expose users to misleading messages, impersonation attempts, unsafe links, and privacy risks. Cybersecurity awareness helps people pause, evaluate warning signs, verify requests through trusted channels, and avoid sharing sensitive information.

CyberAware Campus aims to make this learning approachable by organizing cybersecurity concepts into small lessons and practice activities. Rather than testing real systems or handling real credentials, its threat-simulation concept uses fictional examples to teach recognition and safe decision-making.

3. Problem Statement

Many students may not consistently identify phishing messages, social-engineering tactics, misleading URLs, or unsafe requests for confidential information. Traditional awareness materials can be passive and may not give learners enough opportunity to practice decisions and receive immediate explanations. A simple, centralized, interactive platform can provide structured learning, knowledge checks, and progress visibility.

4. Objectives and Scope

Objectives

- Introduce students to essential cybersecurity concepts in clear language.
- Teach common warning signs in phishing, social engineering, and suspicious links.
- Reinforce learning through topic-based quizzes and answer explanations.
- Offer fictional, safe threat-recognition scenarios for practice.
- Provide a way to review learning progress and quiz performance, where supported by the implemented app.
- Support maintainable educational content for future updates.

Scope

The project is designed for awareness education in a college context. It may include student-facing learning pages, quizzes, a safe threat simulator, progress views, and administrative content management depending on the features enabled in the published app. It does not aim to perform real penetration testing, malware analysis, live URL scanning, or automated incident response.

5. Proposed System and Key Modules

5.1 Landing Page

Introduces the platform, its purpose, and its main learning activities. Calls to action guide users toward lessons or the learning dashboard.

5.2 Learning Hub

Organizes lessons into topics such as cybersecurity basics, phishing, social engineering, password security, safe browsing, public Wi-Fi, digital privacy, and malware awareness. A lesson can contain an explanation, practical tips, examples, and a completion action.

5.3 Quiz Center

Provides multiple-choice knowledge checks. A typical flow presents a question, accepts a selection, shows feedback, and calculates a result. Persistent quiz history should only be claimed if it has been tested in the deployed application.

5.4 Safe Threat Simulator

Presents fictional email, message, or URL examples and asks learners to identify warning signs. Feedback explains cues such as urgency, unusual sender details, misleading domains, and requests for sensitive information. The simulator is educational: it should not open malicious links, send messages, collect real passwords or one-time passcodes, or interact with real targets.

5.5 Student Progress and Achievements

May summarize completed lessons, quiz scores, learning history, and badges. Metrics should be derived from saved records rather than hardcoded sample values. Any illustrative data should be labelled clearly.

5.6 Administrator Content Management

If enabled, an administrator area can support maintaining lesson content and quiz questions. Access to administrative actions should be restricted using actual authorization checks, not only by hiding menu items.

6. System Workflow

1. Access
Open the published app and sign in if required.

2. Learn
Choose a topic and review the lesson.

3. Practice
Attempt a quiz or fictional threat scenario.

4. Review
Read explanations and review the result.

5. Track
Check saved progress, if persistence is enabled and verified.

7. Technology and Architecture

Development platform: Base44 AI App Builder. Base44 provides tools for generating app interfaces and workflows, and can provide built-in database and authentication capabilities depending on configuration and plan. The published application URL is supplied by the project owner.

High-level architecture

Student / Administrator

↓ Browser-based interface

CyberAware Campus Web App
↓ Application workflows and access rules
Base44-supported data and authentication services

The diagram is conceptual. Confirm the actual entities, authentication settings, and access rules in the Base44 editor before using it as a precise implementation diagram.

8. Data Design

The following entities are a suggested logical data model. The actual published app may use different entity names or may not implement every entity.

Entity	Purpose	Example fields
User Profile	Profile and role information	User reference, display name, role
Lesson	Learning content	Title, topic, content, difficulty, status
Quiz Question	Knowledge-check questions	Topic, prompt, options, correct answer, explanation
Lesson Progress	Track lesson completion	Student reference, lesson reference, status, date
Quiz Attempt	Record quiz outcomes	Student reference, score, total, date
Achievement	Record learning milestones	Student reference, badge identifier, earned date

9. Security and Privacy Considerations

- Use the platform's supported authentication and role controls where configured.
- Keep student records limited to the data needed for learning and progress tracking.
- Check that students cannot view or modify other students' private records.
- Restrict administrator operations through server-side or platform-enforced authorization rules.
- Never ask learners to enter real passwords, OTPs, or other secrets into a simulator.
- Use fictional domains and scenarios; do not execute attacks or open suspicious links.
- Test permissions and privacy behavior before demonstrating or publishing the application.

10. Testing Plan

Run the following manual checks against the live app and record the actual outcomes before submitting this documentation.

Test	Expected result	Actual status
Landing page	Loads and navigation links work	To be tested
Authentication	Valid sign-in works; invalid input shows feedback	To be tested

Test	Expected result	Actual status
Lesson completion	Completion action updates the interface and persists if implemented	To be tested
Quiz scoring	Score and explanation match selected answers	To be tested
Progress persistence	Progress remains after refresh/re-login if implemented	To be tested
Authorization	Student cannot access admin-only actions	To be tested
Threat simulator	Only fictional scenarios; feedback is appropriate	To be tested

11. Limitations

The platform is intended for cybersecurity awareness, not as a production security scanner. A fictional scenario simulator cannot establish whether a real email, URL, or device is safe. Available features depend on what was generated, configured, and verified in Base44. No performance or learning-outcome claims should be made without actual testing and evidence.

12. Future Enhancements

- Add more original scenarios covering current online scams and privacy risks.
- Introduce multilingual lessons for broader accessibility.
- Add instructor-created learning paths and classroom challenges.
- Provide aggregate educator reports while protecting student privacy.
- Conduct usability testing and assess learning with pre- and post-lesson quizzes.

13. Conclusion

CyberAware Campus presents an accessible approach to cybersecurity education by combining lessons, knowledge checks, and fictional practice scenarios in a web-based experience. Built with the assistance of Base44, the project demonstrates how an AI app-building platform can be used to turn a project idea into a shareable application. Its value depends on clear educational content, safe simulation design, reliable data handling, and testing of the features that are actually implemented.

14. GitHub Repository Notes

Suggested repository structure

```
CyberAware-Campus/
■■■ README.md
■■■ docs/
■ ■■■ CyberAware_Campus_Project_Documentation.pdf
■■■ screenshots/
■ ■■■ (add screenshots of the live application)
■■■ LICENSE (optional; choose a license only if appropriate)
```

Recommended README details

- Project title and short description.
- Live application link: https://cyber-campus-guard.base44.app
- Features that have been tested and are available.
- Development approach: created with Base44 AI App Builder.
- Screenshots of the actual app (avoid presenting concept mockups as real screens).
- Testing checklist and known limitations.

Important: a PDF document alone is documentation; it does not contain the full source code of the Base44 application. If you want to publish source files, use Base44's available export or GitHub integration options and review the repository before publishing.
